19. Next Steps / Discussion

# Executive Overview

This document presents UniCord's understanding of NEIPL's current manpower competency evaluation process, and our proposed approach for a centralized Manpower Training & Competency Management Platform — prepared as a discussion document for our first detailed working meeting.

1

## What This Is

A discussion document bringing together what we've learned so far, and the solution direction we recommend.

2

## What's Confirmed

Sections through this deck are marked where a direction is confirmed vs. still to be validated with NEIPL.

3

## What's Next

Section 18 consolidates every open item — our meeting will work through these together.

# Understanding NEIPL's Current Process

NEIPL evaluates manpower competency using a structured, Excel-based format — four components rolled into an overall competency score, followed by Learning Need Identification. Applied across categories including Shift Incharge, Filter Operator, R.P. category, Helper / RTPI, and Plant Operator.

*The complete list of job categories, and the exact evaluation content for each, is still to be confirmed with NEIPL.*

## Current Challenges

The current process works, but its Excel-based nature creates natural limits as it scales across employees and sites:

- Each employee's assessment lives in a separate spreadsheet — no central, searchable database
- Scoring and roll-up are manual, which takes time and leaves room for error
- No automatic link between an assessment outcome and the training that should follow it
- No centralized visibility for management across sites without manually collecting files
- Training history and competency trends over time are difficult to track and analyze

# Proposed Solution

One centralized platform covering NEIPL's complete competency and training lifecycle — from onboarding to certification.

# Employee & Workforce Management

A central Employee Master — one authoritative record per employee, replacing scattered spreadsheets.

|                             |                                             |                    |              |
|-----------------------------|---------------------------------------------|--------------------|--------------|
| Employee ID & basic details | Designation, department, job category, site | Experience         | Documents    |
| Assessment history          | Training history                            | Competency history | Certificates |

## SECTION 6

# Job Category & Competency Framework

Each job category has a meaningfully different skill set. Rather than one fixed structure, the framework is configurable — every category can define its own:

- Competencies and skills / abilities
- Evaluation criteria
- Practical tasks
- Oral parameters
- Written assessment content
- Scoring, weightage & required levels

### Categories seen so far:

Shift Incharge / Site Incharge

Filter Operator

R.P. category

Helper / RTPI

Plant Operator

*The complete list, and the exact framework for each category, is still to be confirmed with NEIPL.*

# Assessment Management

The platform supports NEIPL's four assessment types, digitized and made consistent across job categories, each configurable per category.

**1**

## Skill Mapping

Structured evaluation of task-level abilities.

**2**

## Practical

Hands-on / applied skill assessment.

**3**

## Written

Knowledge-based assessment.

**4**

## Oral

Conversation-based assessment, conducted and scored by the evaluator.

# Automated Scoring & Competency Evaluation

The system automatically calculates individual assessment scores, weighted scores, overall competency percentage, competency level and status, and training-required indicators — removing the manual roll-up currently done by hand.

*Automated scoring applies to Skill Mapping, Practical, and Written. The Oral assessment remains manually scored by the evaluator, since it's a live conversation — its score is entered and included in the same automated roll-up as the other three.*

# AI-Powered Gap Analysis

Beyond fixed threshold rules, AI reads assessment patterns across an employee's competency areas to identify meaningful gaps — for example, distinguishing strong written knowledge from weaker practical troubleshooting ability.

*This connects assessment results directly to specific competency gaps, and from there to the training required to close them.*

# Personalized Training Recommendations & Predictive Insights

## Personalized Training Recommendations

Based on each employee's identified gaps, the system recommends the specific training modules most relevant to them — rather than assigning the same generic training to everyone in a job category.

## Predictive Competency / Risk Insights

As assessment and training data accumulates, the system helps identify employees, competencies, or sites that may need additional attention before they become a problem — e.g. a site trending toward lower scores ahead of an audit.

*Predictive capability is not expected to be fully mature from day one — its accuracy and usefulness grow as NEIPL's historical data accumulates within the system. We'll scope realistic expectations for this together during discovery.*

# Training Management

The platform manages the complete training lifecycle that follows a gap analysis:

- Training requirement identification
- Training assignment & employee enrollment
- Training calendar, monthly / yearly planning
- Trainer assignment and scheduling
- Reminders
- Attendance & completion tracking
- Training history
- Post-training evaluation and reassessment

# Video Meeting & Online Training

Online sessions are part of the training workflow itself — not a separate, disconnected feature.

# Reassessment & Certification

## Reassessment

*Cycle repeats for continuous competency improvement*

## Certification

- Certificate generation
- Certificate details, competency / category, and issue date
- Validity period, if applicable
- Linked employee certification history

# Management Dashboard & MIS

Consolidated visibility across all sites through a central dashboard, covering:

- Employee, site-wise & job-category-wise competency
- Assessment status and training status
- Pending and upcoming training
- Competency gaps and compliance
- Trends over time

Supported by MIS reports — employee competency, site-wise, assessment, training, Learning Need Identification, competency gap, certification, and training history.

*Exact report formats and specific fields will be finalized together with NEIPL, rather than fixed in advance.*

# Roles, Permissions & Audit Trail

Access will be role-based. The roles below represent a proposed starting structure:

| Role                | Typical Access                                                                   |
|---------------------|----------------------------------------------------------------------------------|
| Admin               | System configuration, job category / competency framework setup, user management |
| Management          | Cross-site visibility, dashboards, reports, approvals                            |
| Evaluator / Trainer | Conducting assessments, entering scores, delivering and tracking training        |
| Employee            | Own profile, own competency record, own training schedule and certificates       |

*Exact role hierarchy will be finalized with NEIPL during discovery. Alongside roles, the system maintains an audit trail of key actions — assessment updates, score entries, training assignments, employee record changes, template changes, and approvals.*

# Multi-Site Management & Data Migration

Centralized management across all NEIPL project sites, structured as a simple hierarchy:

## Data Migration

NEIPL's existing records are Excel-based. We can consider migrating this historical data into the platform, subject to a review of its format, quality, and completeness. We are not committing to a full migration until the actual data has been reviewed and validated together with NEIPL.

# Implementation Approach

An illustrative sequence — actual timelines will be scoped once discovery items are finalized.

**01**

## Discovery

Finalize job categories,  
framework, scale, sites,  
languages

**02**

## Design

Solution design, screens,  
data model, review with  
NEIPL

**03**

## Development

Build in phases with  
regular check-ins

**04**

## UAT

NEIPL testing, feedback,  
refinement

**05**

## Deployment

Go-live, team onboarding,  
support handover

# Items to Finalize During Discovery

To move from this discussion document to a final technical scope and commercial quotation, we'd like to confirm:

- Complete job-category list
- Exact competency framework per category
- Exact scoring and weightage rules
- Competency thresholds
- Number of sites
- Final employee scale
- Languages required
- Detailed training workflow
- Reassessment rules
- Certification rules
- Exact video meeting requirements
- Notification requirements
- Data migration scope
- Final MIS / report formats
- Hosting / deployment requirements
- Integrations, if any
- Detailed AI expectations & available historical data

## SECTION 19

# Next Steps / Discussion

This document is meant to demonstrate that we've studied NEIPL's current process closely and thought through how a complete system can work around it — while leaving the items in Section 18 open for our discussion, rather than assuming them.

We propose using our upcoming meeting to walk through this document together, validate our understanding, and work through the discovery items. Once confirmed, we'll finalize the detailed technical scope and commercial quotation as a separate document.
